MAKING THE FUTURE

Innovative Pathways to Sustainable Development

Globally, we live in an era of unprecedented technological progress where innovative ideas take the lead. While the benefits are widely known, technological change can also lead to sluggish and unsustainable economic growth, and in some cases it has led to widening inequality, especially in developing and emerging economies.

The future we want, however, is not going to be the outcome of technological causes alone, but instead will result from the interplay of diverse political, economic, social, and institutional factors.

This year's Pangkor Dialogue aims to explore possible innovations and solutions to achieve the sustainable development goals in Agenda 2030, with specific focus on optimizing the SDGs at the sub-national level, and focusing on finding an optimal pathway between innovation and sustainable development.

The following questions will be addressed at Pangkor Dialogue 2017

1. What are the disruptors and the barriers to achieving sustainable and inclusive development?
2. How can we create an environment for inclusive and sustainable development that is equipped with the coping strategies to deal with complexity and uncertainties?
3. What are the innovative pathways towards achieving sustainable development practices at the sub-national level, and how did they unfold over time?
4. How do we ensure that disruptive innovations benefit human development?
5. How to mainstream innovation-led sustainability solutions in public policy and what transition management strategies should be put in place?
